1. **Location:** The tachometer should be located at least 18" from a magnetic compass. Some interference (erratic operation) may be noticed on the tachometer during radio transmissions. This will neither damage a Faria® tachometer nor affect accuracy when not transmitting.

2. It is recommended that you use the included color coded wire extension leads.

3. Cut a 3-3/8" dia hole in the dash and mount the tachometer with the backclamp supplied.

4. Connect the Grey wire to the Harness connector marked (Ignition).

5. Connect the Yellow wire to the Harness connector marked (signal).

6. Connect the Black wire to the Harness connector marked (ground).

**When a standard side mount remote control is used, the yellow tach signal, switched power gray and black ground wires can be found at the control box.**

7. Connect the MONITOR BY ALIGNING the keys on the gauge’s wire harness plug with the engine MONITOR harness instrument’s receptacle. Push the plug in gently until the catches snap in place.

8. Connect the GREEN/ORANGE extension lead to the blade terminal adjacent to the twist-out light assembly to the positive “+” side of the instrument lighting circuit and the bullet end to the boat lighting circuit.

9. Connect the BLACK extension lead to the other blade terminal of the twist-out light assembly to ground.

Reconnect the battery.

**Note:**

A.) To change light bulb, twist black socket assembly one-eighth turn counterclockwise until it pops out. Bulb pulls straight out of assembly. It is a GE No. 194 instrument lamp.

Trouble Shooting

### Gauge Sticks

**Trouble:** Gauge Sticks  
**Inspection:** A. Backclamp may be too tight.  
**Diagnosis:** 1. Slightly loosen nuts holding backclamp. Check operation.  
**Action:** 1. If gauge works and is not loose in panel continue using gauge.  
2. If gauge continues to stick, replace gauge.

### Gauge Inoperative

**Trouble:** Gauge Inoperative  
**Inspection:** A. Is power applied to gauge?  
**Diagnosis:** 1. Switch the instrument power supply switch on and off. As power is supplied the pointer should jump slightly.  
**Action:** 1. Check wires to check they were installed on the correct terminals and power is actually supplied to gauge.  
2. If pointer jumps (indicating power supplied), check for signal from engine. If signal exist replace tachometer.

### Gauge is Erratic

**Trouble:** Gauge is Erratic  
**Inspection:** A. Inspect the connection between the wire and the ring connector.  
**Diagnosis:** 1. Check for insulation that may have been pushed into connection.  
**Action:** 1. Fix connection.  
B. Check for excessive electrical noise caused by an electrical appliance set to close to the gauge. i.e. a magnetic compass, a radio transmission.  
**Diagnosis:** 1. Check wires by connecting one wire at a time to the Tach directly from the battery or the signal source on the engine.  
**Action:** 1. Relocate offensive appliance. Please refer to installation instructions.  
C. A reading of Hi or Low may be the cause of alternator pole switch not selected correctly.  
**Diagnosis:** 1. Check the switch on the back of the tachometer. Refer to chart below.  
**Action:** 1. If the tachometer reads too high, then the switch is selected too low.  
2. If the tachometer reads too low, then the switch is selected too high.
