Use with:
SystemCheck® Commander™
Speedometer with Depth Sounder

Installation:
**CAUTION:** Disconnect the battery during installation. Tighten nuts on the backclamp only slightly more than you can tighten with your fingers. **Six inch-pounds** of torque are sufficient. Over-tightening could result in damage to the instrument and may void your warranty.

**Mounting**
1. Cut a 3-3/8” diameter hole in the dash and mount the gauge with the backclamp supplied.

   The butt connectors have a heat activated waterproofing. Once the butt connections have been crimped, slowly apply heat with a heat gun until you see sealant coming out of the connector ends. It is recommended to wrap the connections together with electrical tape for further protection.

**Two Wire Connector Socket**
Follow the wiring diagram at the end of this manual for wiring connections. (See Diagram HN0357, **Figure 4**, page 8).

**Four Wire Connector Socket**
Connections for Speed input, Ignition and Ground. Follow the wiring diagram at the end of this manual for wiring connections. (See Diagram HN0353, **Figure 5**, page 9).
Operation

Speedometer
The speedometer is a digital instrument with the appearance of an analog instrument. The speedometer is designed to be operated from a “paddle wheel” sensor. A microprocessor controlled stepper motor moves the pointer to display boat speed using a linear dial.

The microprocessor and stepper motor provide excellent accuracy. Variations in the operation of the “paddle wheel” sensor are however fairly common. These variations may be caused by the mounting location of the “paddle wheel” on the hull, which affects water flow characteristics, or turbulence and air bubbles in the area of the “paddle wheel”. Therefore, calibration of the speedometer may be required and is easily accomplished by using the Trip Log display or the pointer.

Description

The SystemCheck® Commander™ Speedometer has three push buttons;

The “Mode” button is used to change the function of the LCD display and to access sub menus and adjustable settings. The “Down” and “Up” buttons are used to modify the settings.

In normal operation mode, pressing the “Mode” button for a short period of time causes the display to cycle between the Depth Sounder display and the Trip Log display. Pressing and holding the “Mode” button causes the display to change to the “settings” sub menus (see Figure 2, page 6).

When the settings menus have been selected, pressing the “Mode” button for a short period of time causes the display to cycle through the setting options. Within each setting selection, pressing the “Down” and “Up” buttons causes the affected setting to change. The microprocessor will automatically record the new settings as you adjust them.

When in a setting menu, pressing and holding the “Mode” button returns to the main function.

Trip Log

The Trip Log is similar to the trip odometer in an automobile. The distance traveled, as recorded by the speedometer “paddle wheel”, is displayed.

The Trip Log may be reset to zero, the units of measure changed, or the
calibration adjusted using the sub menus.
Pressing and holding the “Mode” button while the Trip Log is displayed will change the display to the “settings” menu (see Figure 2, page 6).

**Trip Log “Settings” Menu**
There are three items in the Trip Log “Settings” Menu: Reset, Units, and Calibration. Briefly pressing the “Mode” button cycles through the menu items.

The microprocessor will automatically record the new settings as you adjust them.

**Reset**
Pressing the “Up” and “Down” button resets the Trip Log to zero.

**Units**
Pressing the “Up” or “Down” button cycles the units of measurement for the Trip Log between miles (MI) and nautical miles (NM).

**Miles**

**Nautical Miles**

**Calibration**
This menu item is used to simultaneously adjust the calibration of the Speedometer and the Trip Log. Two methods of calibration are possible. These methods will discussed in the Calibration Section.

**Depth Sounder**
The Depth Sounder displays the depth of the water under the boat.

The depth can be displayed in feet, meters, or fathoms. Audible and visual alarms can be set to warn of shallow or deep water conditions. A “keel offset” setting allows the operator to adjust for the difference in the location of the Depth Sounder transducer compared to the deepest part of the boat’s hull. The various settings are accessed by pressing and holding the “Mode” button while the Depth Sounder is displayed (see Figure 2, page 6).
Depth Sounder “Settings” Menu
There are four items in the Depth Sounder “Settings” Menu: Shallow Alarm, Deep Alarm, Keel Offset, and Units. Briefly pressing the “Mode” button cycles through the menu items.

The microprocessor will automatically record the new settings as you adjust them.

Shallow Alarm

Pressing the “Up” or “Down” button changes the setting for the Shallow Alarm. Setting the Shallow Alarm to zero turns off the alarm. To have this alarm indicate the depth of water under the deepest part of the hull, the Keel Offset must be properly set.

Deep Alarm

Pressing the “Up” or “Down” button changes the setting for the Deep Alarm. Setting the Deep Alarm to zero turns off the alarm.

Keel Offset

Pressing the “Up” or “Down” button changes the setting for the Keel Offset.

Negative numbers indicate that the Depth Sounder transducer is located ABOVE the deepest part of the hull (typical). Allow for worst case boat loading when adjusting the Keel Offset as this setting affects the Shallow Alarm.

Units

Pressing the “Up” or “Down” button cycles the units of measurement for the Depth Sounder between...
feet (FT),

meters (m),

and fathoms (FA).

Loss of Signal
When the Commander™ looses signal from the transducer, the LCD display will flash the following;

There are two methods of calibration;

1) A GPS or radar gun can be used to obtain a fixed speed. While holding the boat at the selected speed press the “Up” or “Down” buttons to adjust the speedometer pointer reading to match the GPS or radar gun indicated speed.

2) The Trip Log can be set to zero and then a course of known distance run, such as between two buoys or by using a GPS. At the end of the run access the Calibration menu item.

Press the “Up” or “Down” buttons to adjust the recorded Trip Log distance to match the known distance. This will calibrate both Trip Log and the Speedometer.

Calibration

Speedometer / Distance Traveled
Calibration is done in the Trip Log “settings menu”. (See Figure 2)

Calibrate
Press the “Mode” button to display the Trip Log.

Setup Mode
The speedometer full scale deflection setting can be changed using the Setup Mode (see Figure 1). Use this option only if you have reason to believe that your setting is wrong. Setting an incorrect value in this menu can result in extremely inaccurate performance of the speedometer. To access the Setup Mode, press and hold both the “Up” and “Down” buttons while turning on the instrument.

The display will show “*SETUP*”. Briefly pressing the “Mode” button will change the display to the setting menu.

The “Up” and “Down” buttons are used to modify the setting.
The microprocessor will automatically record the new setting as you modify it.

Pressing and holding the “Mode” button sets the instrument to normal operation.

**Speedometer Full Scale Selection**

Refer to Figure 3 (below) for an explanation of each of the speedometer full scale selections.

This is normally a factory setting that needs no adjustment. The setting adjusts the “full scale” operating range of the speedometer to match the dial on the instrument. Using the “Up” and “Down” buttons,

Adjust the setting to match the maximum reading on the speedometer dial: 50 or 70 MPH.

---

**Quick Reference Guide**

**Set-Up Mode**

**ENTER SETUP MODE:**
Press both the “Up” and “Down” buttons while turning on instrument
To exit the setup mode, press and hold the “Mode” Button

**SETUP start screen,**
shows that setup mode has been entered.

**Flashes “S SCALE”** and then shows current speedometer scale selection.

**Screen shows:**
“*SETUP*”

**Screen shows:**
“50”, or “70”  Default = 70

Use the “Up” or “Down” button to adjust speedometer full scale reading to match dial.
